IT ALL STARTED IN

MENDOCINO COUNTY

ucbiotech.org

March 2004 MENDOCINO
MEASURE H -2,579 signatures obtained

- "unlawful for any person, firm, or corporation to propagate, cultivate, raise, or grow genetically modified organisms in Mendocino County" (excludes microorganisms)

- "DNA or deoxyribonucleic acid means a complex protein that is present in every cell of an organism…"

- The ban does not pertain to properties within city limits, or lands managed by State, Tribal and Federal agencies.

- At election time, no GE organisms were known to be in production in Mendocino County.

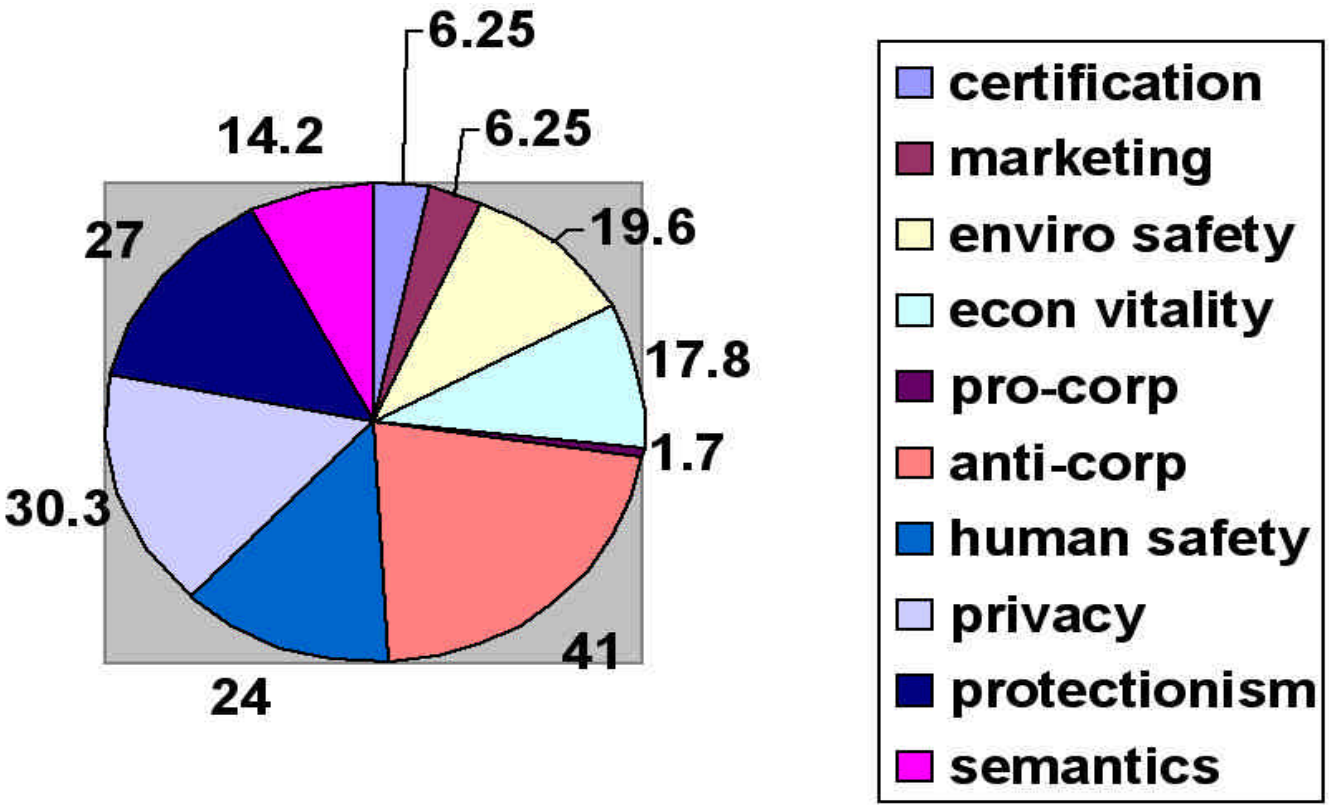
CHARACTERIZATION OF MEASURE H ELECTION RELATED MATERIALS IN MENDOCINO COUNTY



Giusti *et al.* (2004) **Focus on Genetically Engineered Crops and Foods - A Case Study from Mendocino County's Public Debate.**

The discourse was driven in many cases by alarming assertions and facts that are not derived from, nor supported by science

"When my son was 6 month (sic) old and receiving chemotherapy for leukemia, he was also receiving soy lipids intraveneously because he had lost the ability to eat or drink. The longer he received the lipids, the higher the dose of chemo. When I asked why, I was told that the soybeans used were genetically modified to be "Round Up Ready," they were putting food into my son's veins that could withstand the chemicals they were using to kill the leukemia blood cells, making the chemo less effective. In order to keep my son alive nutritionally, the higher doses of chemo almost took him away "

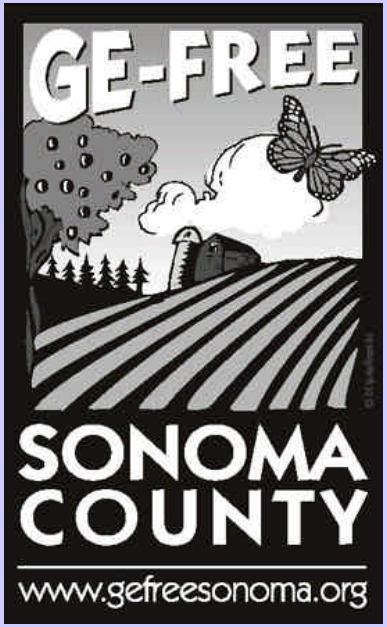
WHY DO WE NEED TO PASS THIS "GE-FREE" INITIATIVE

A "GE Free Sonoma County" will be good for our farmers, good for our environment, good for business, good for public health, and good for our democracy!



We need to protect the right to farm. Those farmers who choose to farm without GE crop varieties must have the right to do so…

We need to protect our…environmental, public health and economic future…until there is public, peer-reviewed science available, with multigenerational studies on all the long-term impacts of these very new technologies…

We need to protect the public health of the people of Sonoma County… Such exposure could occur through GE pollen inhaled or plants eaten, or by increased exposure to toxic herbicides and pesticides used to kill the new "super weeds" and "super bugs"…

SONOMA COUNTY ORDINANCE

Qualified for November 2005 Ballot

needed 40,000 signatures

Section 4. Prohibitions.

(a) It is unlawful for any person to engage in the propagation, cultivation, raising, growing, sale or distribution of transgenic organisms in Sonoma County.

(b) It is unlawful for any corporation or other legal entity to engage in the propagation, cultivation, raising, growing, sale or distribution of transgenic organisms in Sonoma County.

(c) Any act in violation of paragraph (a) or (b) of Section 4 of this Ordinance is declared to constitute an imminent endangerment of agricultural health and environmental health and as such is declared a public nuisance.

(d) It is beyond the authority of the governments of the United States or the State of California, or any of their agencies, to deny the right of the people of Sonoma County to prevent Agricultural and Environmental contamination from transgenic organisms.

(b) Nothing in this Ordinance shall make it unlawful for state or federally licensed medical or agricultural research institutions, medical or agricultural laboratories or medical or agricultural manufacturing facilities in Sonoma County to conduct licensed medical or agricultural research or production involving transgenic organisms whose reproduction in the environment can be physically contained (following USDA protocols and guidelines at the BSL-3-Ag containment level or greater as outlined in USDA Departmental Manual No. 9610-001).

Data on Genetically Modified Corn Reports Say Threat to Monarch Butterflies Is 'Negligible’

By ANDREW POLLACK

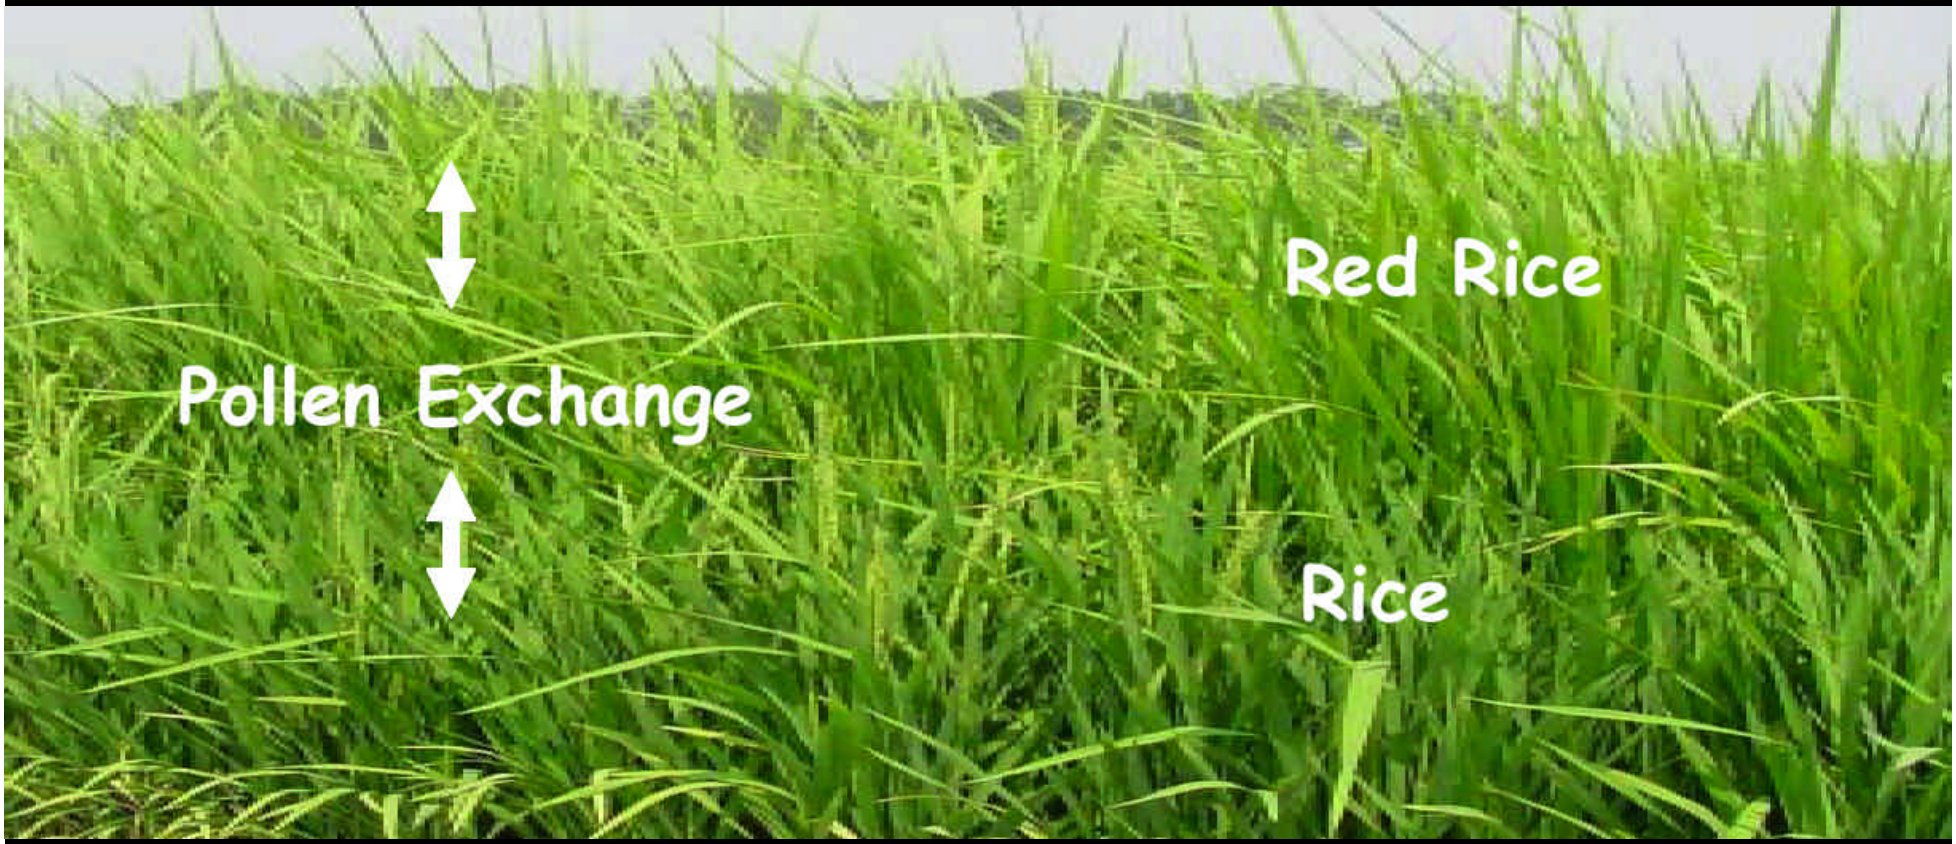
Genetically modified corn poses a "negligible" risk to monarch butterflies, according to a package of six papers that will soon be published in a scientific journal. The papers, the most comprehensive peer-reviewed publications on this issue, could lay to rest one of the biggest controversies over genetically modified crops.

Parasitoid wasp of canola pest not affected by B.t. canola, making it ecologically superior to conventional insecticides that kill the wasp.

SOURCE: Poppy et al., 1999. Parasitoid behaviour and Bt plants. Nature 400: 825.

B.t. – positive effect on unintended pest?

Movement of Genes from Crop Species to Wild, Weedy Species e.g., Commercial Rice to Weedy Red Rice



ISSUES WITH PHARMA CROPS

PRODIGENE

- Planted soybeans in field previously used for transgenic corn.
- USDA discovered "volunteer" corn plants growing among soybeans. Instructed ProdiGene to remove corn plants.
- Soybeans harvested before all corn was removed, mixed with 500,000 bushels of soybeans.
- Soybeans destroyed, ProdiGene paid $250,000 civil fines, reimbursement for lost crops; $1 million higher regulatory fees.

Consequences of Gene Flow on Genetic Diversity: Transgenes in Mexican Landraces

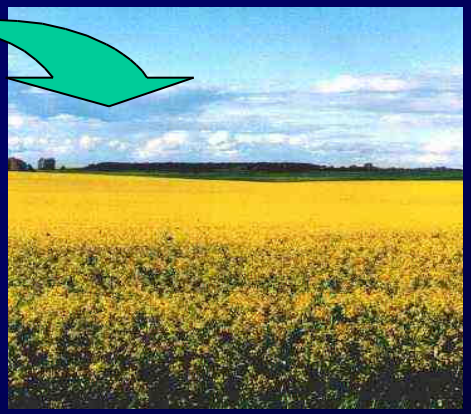
How did pollen and gene flow occur in Mexico?

Is this the first time gene flow into Mexican, maize landraces happened?

What implications does transgene flow have for wild and domesticated maize?

Consequences of pollen spread from GE crops to organic crops in the field

GM canola



non-GM canola

Will an organic farmer automatically lose accreditation if his/her crop is found contaminated with a GE crop?

No.

"As long as an organic operation has not used excluded methods and takes reasonable steps to avoid contact with the products of excluded methods, as detailed in their approved organic system plan, the unintentional presence of the products of excluded methods should not affect the status of an organic product or operation."

Plant Biotechnology Group
In-depth understanding of biotechnology and its issues is a necessary factor in informed dialogue and making wise decisions about the use of this technology and its products. This section has commonly raised issues associated with a variety of topics relating to biotechnology and agriculture. The issues are paired with responses, which contain links to relevant scientific references. The content of the Issues and Responses section and the choice of literature cited is the sole responsibility of Peggy G. Lemaux and Petra Frey at the University of California, Berkeley, in collaboration with the Plant Biotechnology Group, ETH, Zurich, Switzerland and Dr. Alan McHughen, Cooperative Extension Specialist, University of California, Riverside.

Do Bt plants affect beneficial insects?
The effect of Bt plants on non-target insects has been studied using a broad range of different insects, both in the laboratory and in the field. In one of these studies Bt176 corn pollen and a control corn pollen were fed to lady beetle larvae, where 69% of the larvae survived on Bt pollen and 61% of the larvae survived on the control pollen [Pilcher, 1997]. Another group tested the effect of Bt 176 corn on aphids feeding on leaves and the effect this would have on their natural predators, the green lacewings. They could not find any significant effect of the Bt corn on aphid larvae development or green lacewing mortality [Lozzia, 1998]. A further study tested the predation and parasitism of the European corn borer, using the same Bt176 corn variety, in the field. Also in this case, the predation and parasitism was the same on Bt and on non-Bt corn [Orr, 1997]. No significant negative effect of the Bt corn could be found in any of these studies. The results of two recent studies, however, showed that monarch butterfly larvae could be adversely affected by pollen from certain varieties of Bt corn (Bt 11 [Losey, 1999] and Bt176 [Hansen Jesse, 2000]). These laboratory studies demonstrated that monarch larvae were more likely to die when fed milkweed leaves dusted with pollen from Bt corn than when fed leaves dusted with pollen from conventional corn. Both of these laboratory studies used Bt pollen at very high concentrations that are not encountered beyond the edge of a field [Betz, 2000]. An analysis of the results from a field-study of effects on swallowtail larvae, where mostly lower pollen

Genetic Engineering and Pollen Flow

NORMAN C. ELLSTRAND, PH.D., Professor of Genetics and Director, Biotechnology Impacts Center, University of California, Riverside

INTRODUCTION

Pollen grains are the vehicles that transport a plant's male cells or gametes. For most plants that produce pollen, it is transported by wind and insects plus many species are able to self-pollinate some or most of their own female cells or eggs. Typically, the

Science-based, Peer-reviewed FACT Sheets on the Issues

What are the consequences when traditionally bred crops cross with wild relatives?

The vast majority of the attention has focused on engineered crop genes in natural populations. For guidance about future problems with engineered crops, we can ask whether traditionally improved crops have hybridized with wild relatives, and if so, whether those hybrids have caused any problems. Most cultivated species naturally hybridize with some wild relative or relatives somewhere in the world (Ellstrand 2003a). In some cases, such as coffee, those wild relatives are geographically restricted. On the other hand, one or more wild relatives of rice are usually found where rice is cultivated worldwide. The vast majority of cases involving hybridization of cultivated plants and their wild relatives has been of little consequence. However, such hybridization, on occasion, has created two classes of problems:

The evolution of new or more difficult-to-control weeds. In particular, the evolution of a new weed beet in Europe – a hybrid of sugar beet and an innocuous wild species - has resulted in well over a billion dollars of damage to Europe's sugar industry in terms of reduced yields and increased management costs (Ellstrand 2003a). In California, hybridization between rye and a wild relative has been implicated in the evolution of a new weedy rye variety that has hurt the wheat and rye industry in the northeastern part of that state (National Research Council 1989).

Another Voice
BY PEGGY LEMAUX

Editor's note: the following introduction by John Harper of the UC extension Service explains this column.

John Harper: In light of the activity concerning Measure H, reading the letters to the editor, and the questions we've been getting at the UC Cooperative Extension office, local farm advisors, including myself, Glenn McGourty and Greg Giusti, have been collaborating with several of our extension biotechnology specialists at three of the UC campuses. Those specialists are Peggy Alan McHughen and Alison Van

Animal biotechnology

Another voice BY ALISON VAN EENENNAAM

Editor's note: This is the second in a series of articles on biotechnology provided by the Ukiah UC Cooperative Extension Service Farm Adviser's office. The author of this article is Alison Van Eenennaam, PhD., UC Davis.

A recent study of public knowledge about biotechnology, genetic engineering, and genetic modification by Rutgers University found that the majority of Americans claim to know "very little" (55 percent) or "nothing at all" (22 percent) about biotechnology. This knowledge gap and related discomfort is particularly apparent in the case of animal biotechnology. This is evidenced by the fact that in this same survey the majority of people stating that they knew "nothing at all" about animal biotechnology, also disapproved of its use.

Animal biotechnology encompasses a broad range of technologies including the widely-used artificial

Questions on Measure H

Another voice BY ALAN MCHUGHEN

Voters in Mendocino are being asked to ban "GMOs" - genetically modified organisms - from being grown in the County. The local media has given considerable coverage to

Although an "out-of-towner," I am concerned for the state of democracy in all California counties. As a public scientist supported entirely by taxpayers, I conclude that Mendocino taxpayers simply have not been given enough clear and accurate information to make an informed decision, whether for or against Measure H.

Too many crucial questions remain unanswered. What, exactly, will be banned and what will be allowed? The legal wording is disappointing and what will be allowed? The legal think the measure will ban seedless grapes, broccoflowers, poinsettias and other products of modern plant breeding.

Some think it will ban any plants or animals produced using genetic engineering techniques. Others think it will ban crops trans carrying genes from different species. Almost will fall into one of these groups. Yet, according of the initiative, all of these people are racy threw where the majority they're voting on?
